

Edoofa - Audit Exercise [Time - 02 Hours]

You have been given two problems. Attempt them in the same order and submit both the problems by 12:00 PM

Note for both problems: Following submission, you'll be asked to walk through specific design and formula choices in a short conversation, and to respond to a new requirement on the spot. You should know what each function, tool, or step in your solution does, why you chose it, and what its limitations or failure modes are.

Problem 1 - Data Round

You have been given a raw dataset of 1,000+ student records from Edoofa - exported as-is from the system. The team uses this data to manage daily student follow-ups, track counsellor performance, and monitor fee collection.

Note: this role involves daily, hands-on work in Google Sheets/Excel - building and debugging formulas is core to the job, not incidental.

This task must be completed in Google Sheets using formulas only. Using AI-generated formulas, scripts, or code will be flagged. At any point during the test you may be asked to explain and modify specific formulas live, without AI assistance - only submit what you can defend. If you cannot do the same assignment with excel, you can let the team know and move to the second question.

Dataset: [CSV LINK](#) || Import this into Google Sheets to begin.

Tab 1 - Cleaned Data

Create a new tab called Cleaned Data. Do not alter the original imported sheet. Every cell in Cleaned Data must be formula-driven from the raw sheet. No manual typing. No copy-paste. No find and replace. The formula bar will be checked during review.

The dataset has been exported as-is from the system - it has not been cleaned or validated. Go through each column, identify what is inconsistent or incorrect, and fix it using formulas. What you catch and how you handle it is part of the evaluation.

Some things worth knowing before you start: names and labels are not consistently cased across the dataset, dates are not in a uniform format and must be standardised to DD-Mon-YYYY (e.g. 27-May-2026), and currencies are not standardised - some amounts have the currency embedded in the value itself, others don't. There may be other issues too. Finding them is part of the task.

The following columns must be filled/added that do not exist in the raw data:

- Full Name - combined from the raw name fields
- Balance Due - calculated from the fee columns
- Fee Payment Status - calculated as Full Paid, Partial Paid, Unpaid, or Deadline Missed
- Duplicate - mark each record YES or NO, finding the Unique ID is on you
- All fee values must be standardized to USD. Use a fixed exchange rate of 1 USD = 80 INR. Do not create helper columns - the conversion and currency extraction must be handled within the formula itself.

Tab 2 - Analysis

Create a new tab called "Analysis." Build the following three tables using your cleaned data.

Table 1 - Counsellor Performance: The team wants to know how each counsellor's portfolio is distributed across enrollment statuses. Build a summary table that shows total students per counsellor, breakdown by status, sort by total students, highest to lowest.

Table 2 - Country & Fee Overview: The team needs a country-wise view of enrollment numbers and fee collection. Build a table that shows total students, total fee to be collected, total fees collected, and total balance due per country. Sort by student count descending.

Table 3 - Pipeline Tracker: The team needs to know where payment follow-ups are most urgent. Build a table that shows for each counsellor: total students, total paid, students who are unpaid with a deadline falling within the next 7 days, students who are unpaid with a deadline more than 7 days away, and students who have missed their deadline. Sort by Deadline Missed, highest to lowest - the most critical counsellors should appear at the top. All data must be formula-driven and updated dynamically based on today's date.

Submission: Share your Google Sheet with edit access to techsupport@edoofa.com. Your access will be changed to view-only immediately - you cannot edit after.

Problem 2 - Audit Tool Round

As part of the process, Edoofa's counselors communicate with prospective students and their families over WhatsApp - daily updates, program details, fee discussions, and more. As the company grows, leadership needs a way to review these conversations for quality: are counselors communicating in a way that reflects the standard Edoofa wants to be known for?

Your task: Attached are two such conversations (Click to download [Chat 1](#) & [Chat 2](#)), with names replaced by roles (Career Counselor, Parent, Student, etc.) for privacy. Build and deploy a tool where someone can upload a conversation like this - one file, or several - and get back a report of findings.

A finding doesn't have to map to a single message. Some of the most important ones are patterns that only become visible across several messages - a promise made early that's contradicted later, a tone that shifts after a particular point, or a question that was not addressed. These are some kinds of pressure recurring at different times for students. For each finding, show what the issue is, which message(s) it's based on, why it matters, and how serious it is.

How you organize this is a part of the evaluation. The metrics you define is what will set you apart. Someone reviewing it should see the patterns that span the conversation alone or across students, not just one long list of flags.

Before running any analysis, submit your audit framework: the categories you will use, what each one is measuring, and why it matters for Edoofa specifically. This must be submitted within the first 40 minutes. Your implementation & findings will be evaluated against this framework, not against what the model produced.

What to submit:

1. **A link to your deployed prototype.** We should be able to open the application, upload one or more chat files, run the analysis, and review the generated findings report. The implementation can be partial or rough; we are evaluating your approach, reasoning, and ability to turn a problem into a usable tool rather than production-ready polish.
2. **A screen recording (5–10 minutes maximum)** demonstrating the end-to-end workflow: uploading chats, running the analysis, reviewing the output, and explaining the key features of your solution.
3. **A one-page explainer document** covering:
 - The metrics you chose & why they matter
 - How your tool works
 - The audit framework and categories you chose
 - Any AI tools, models, or workflows used
 - Key design decisions and trade-offs
4. **The output generated by your tool should be automatically updated to a Google sheet** for the provided chats. Your findings should focus on the issues and patterns you believe are genuinely important, rather than simply reproducing model output.

You are encouraged to use AI throughout the build, not for the analysis. The quality of your analysis will play a significant role in the evaluation. We are interested not only in what the model produces, but in your ability to identify weak conclusions, validate important findings, recognize broader patterns, and apply your own judgment. Make sure the final submission reflects what you actually think, not just what came out first. Share your submission to techsupport@edoofa.com by 12:00 PM.
